Transcript

Today, an injection was administered to a female patient with peritoneal cancer at a German clinic for two tumors: one tumor had a volume of approximately 40 ml, and a smaller tumor had a

volume of about 3 ml. We injected 10 ml and 5 ml of CDS, respectively. The smaller 3 ml tumor only required 1 ml for injection, but I decided to inject 5 ml to ensure that any excess CDS could perfuse a larger, ultrasound-invisible tumor in the abdominal cavity.

About 30 minutes after the injection, ultrasound imaging revealed extensive necrosis in both injected tumors, and two hours later, the necrotic areas had increased further. The patient has since driven home with her daughter, a distance of 100 kilometers.

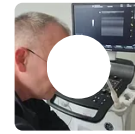

This peritoneal cancer patient was diagnosed by a Swiss doctor about a year and a half ago, who estimated her survival to be only three months. The doctor prescribed chemotherapy, which led to severe reactions in the patient. Subsequently, she came to the German clinic, where I collaborate, to receive alternative therapy. Aside from the tumors not shrinking, there were no visible signs of weakness in the patient. Today, after approximately 5 minutes of injection treatment (excluding anesthesia), ultrasound assessment showed that most of her tumors were necrotic.

Very interesting.

How did her body deal with the necrotic tissue? Any issues?

The necrotic tissue will be gradually absorbed by the body, and the entire tumor may shrink or disappear

over time, which could take about 30 days. This process is generally without issues; the only thing to be

The German clinic has not shared all the information with me. This patient is a patient of the clinic, and another post of mine describes her significant tumor reduction results. Last week, I asked the patient, and she indicated that the tumor still exists, but I do not know why she has not continued the injections (I do not know how many injections she has completed).

Dr Liu, did you find out if this patient completed the 4 injections? Or why not if she didn't? Did she maybe have bad reactions from it?

Author

I suspect that someone has completed all four injections, but the German clinic has not updated the data in a timely manner. They are extremely busy.

Thank you. I spent half a day exploring the beautiful city of Basel. The German clinic is just across the river from Switzerland.

Dr Liu, you performed this injection at the German clinic, so if I go to this clinic but you aren't there, who's going to perform the injections? Thank you

Under normal circumstances, I will work with German doctors to develop your treatment plan. Therefore, if possible, please share your medical report with me first.

I am Chinese and do not have a medical license to practice in Germany. I am unable to perform this surgery; all patients receive treatment provided by German doctors.

Are there updates from this patient? Are the tumors shrinking and is the necrotic tissue being reabsorbed by the body (as you wrote would happen) ? 🙏

Liu Author

Yes, the breakthrough update can be found here: [Breakthrough in Cancer Treatment] (<https://clo2xuewuliu.substack.com/p/breakthrough-in-cancer-treatment>). The article discusses the case of a patient whose injected tumor has completely disappeared and provides the latest progress on tumor injection with chlorine dioxide treatment.

Angela moreno Jun 19 ...

Hello, my mother is in Colombia. She has a very large tumor in her neck due to thyroid cancer, and a giant lymph node on the other side. The tumor burst, and we're applying CDs with a spray, and it's shrunk in size. What recommendations can you give us, doctor? Or, in which country can you see her for injections? Thank you very much.

Hola, mi mamá está en Colombia, tiene un tumor en el cuello por cáncer de tiroides muy grande, y tiene un ganglio gigante al otro lado. El tumor reventó y le estamos poniendo cds con un spray y a reducido su tamaño. Que recomendaciones nos puede dar doctor? O usted puede atenderla para inyectarla en que país? Muchas gracias

Why is the German Dr saying at the end of the video that because there is no license yet, the patient needs to write a declaration of full responsibility? Is this how it works?

Simo369 May 14 ...

Wow 🙌. One question : what happens to this highly concentrated (20.000) solution left in the body? I understood that the cancerous cells absorb it and get necrotic, but what about the clo₂ that escapes from the tumor? Could this very highly concentrated solution left in the body be harmful?

Thank you 🙌

My related article explains this issue in detail. In simple terms, chlorine dioxide is a strong oxidizing agent. When injected into a tumor, it reacts within minutes (killing cancer cells and destroying the tumor's blood vessels). It then turns into chloride ions and water, leaving no long-term residues. This is basic chemical knowledge.
